Why I Trade Only the First 20 Minutes of the Market

Oliver Velez Trading

so today I'm going to give you all \$50,000. And I'm going to show you how with \$50,000 you can grow it. Trading 20 minutes a day. Just 20 minutes. The first 20 minutes you're going to grow you. I'm going to show you how to grow 50,000 into a 100 into 250 into a half a million into a million dollars. I'm going to do it. I got 45 minutes to do it in. I am going to take 45 minutes and

I am going to change the way you see the markets and hopefully the way you play the market from this day forward. I got 45 minutes to do that. I got 45 minutes to do it in such a way that you'll never

be the same as a market participant again. Now I'm going to take the first 20 minutes of the trading day. Traditionally trading the first 20 minutes has been taboo in the markets. When I started my professional career on Wall Street, December 1986, I was told that no traders trade the first 15 to 30 minutes of the trading day because of the excessive volatility. I would go on eventually to break that rule and set records on Wall Street for being the most profitable trader in the first 20 minutes of the trading day. I travel the world transferring that skill to others. In addition to me transferring that skill to others, I do not do that for free. I do it in the form of an exchange, in the form of you trading my capital.

So if you are willing to trade my capital, I am willing to teach you how to do this without you risking a single penny of your family's money ever. So, I travel around the world giving my money to other other individuals, teaching them what to do with that money, and we split the profits. Zero risk to the trader. If they lose my money, I kill them. No. If if they lose my money, my fault. It means I did not do my job well enough. My top trader has over \$30 million and all the baby ones start off with \$50,000. So today I'm going to give you all \$50,000 and I'm going to show you how

with \$50,000 you can grow it trading 20 minutes a day. Just 20 minutes. The first 20 minutes you're going to grow you. I'm going to show you how to grow 50,000 into a 100 into 250 into a half a million into a million dollars. I'm going to do it. I got 45 minutes to do it in 100.

Okay, let's go. You We're going to need several tools. Five, in fact, \$50,000 to start. Number two, we need a two-minute chart where every bar in the chart represents two minutes of trading. So, we're going to divide the market's activity into two-minut slices. We need

a simple 20 period moving average running through that data. And we need a simple 200 period moving average running through that data. The last thing we need is what I call a tight picture of

power. And I'll teach you what that is. Now, here's a two-minute chart. Every bar represents two minutes of charts.

Obviously, the green bars mean that the stock opened at the bottom of the green and rose to the top of the green. All red bars mean that the stock opens at the top of the red and fell to the bottom of the red. Okay, so green bars are up

bars. Uh red bars are down bars. Now we need a two a 20 period simple moving average which is going to average the last 20 bars so that we see a 20 bar average. and we want to see a 200 bar average. So there's a short period moving average, a short one, and a long one. Moving average systems, you always want to use a short one in conj in in conjunction with a long one. I've superimposed the 20 period moving average and the 200 on that same chart.

Take a look. The one sloping downward is the 20. The one sort of flattish is the 200 period moving average. Let's talk about the states.

When these two moving averages are close together, we call that a tight state. Your stock when the move when those two are close is in a tight state. When those moving averages are far apart is in a wide state. So I want you to understand that the markets at two states. We flow from narrow to wide and back to narrow to wide and that's it. So you can have a tight narrow state with the 20 above the 200 but tight and narrow or you can have a tight narrow state with the 20 a little bit below the 200. Here's a wide state where the 20 and the 200 have separated but separated to the upside. The 20 is above the 200 and you have the from this wide state you're expecting your stock to drop from a wide state because the drop brings you back to narrow. Now if you have the wide state to the downside, the 20 has declined away from the 200.

You're looking from that wide state. What should your stock be ready to do now?

To back up, to go back to narrow. So, if you can start

by knowing the stocks state first, you've got 85% of this game already

figured out. Most problems come from from playing the

wrong state. buying after this

after a wide state or doing the reverse. So get the state right and you've got

85% of your problems and trading are gone. Okay, now let's go back to the

chart. Look to the left hand side of the chart. Look at the left hand side of the

chart. What state is the left hand side? Narrow. Your best opportunities come

from a narrow state. I'm going to repeat this. Your best trading opportunities

come from narrow states. From narrow states, there is usually an explosion

out of the narrow state. And there's flow, there's followth through, there's

trending.

Your second best opportunity comes from where? The wide state. And in the wide

state is when you become what kind of trader? A contrarian. You see a

contrarian. You become the contrarian trader in the wide state. But you are

not the contrarian trader from the narrow state. You go with the flow from

a narrow state. You go with the direction from a narrow state. After the

stock has achieved a wide state, you start to think reverse. I know the

stock's down, but we're wide. I'm now thinking up. There's a time to be a

contrarian and a time not to be a contrarian. Let's talk about positions.

Above the moving average, so you've got a tight, narrow state. above the moving

average is bullish, positive. When your stock opens in the morning, the first

bar opens above a narrow state, the odds of follow through to the upside are like

87%. So you got an 87%

chance that if you open above a narrow state, there is more upside to come.

If you open below a narrow state, the first bar of the

morning opens below, there's an 87% chance of follow through to the

downside. Now, think about this. That means that out of every 100 trades,

you're going to be right 87 times. You're going to be wrong 12 13% of the time. That's how we're going to always have to protect ourselves when we're when we're wrong. So, let's talk about power bars. There are 13 bars the market repeats over and over again. 13 bars. It's like a language. So instead of 27 letters in the language, the market speaks one language with 13 bars. And it repeats these bars over and over again. It doesn't repeat them in a specific order. It might give you bar four, then bar six, then bar one, then bar 13, then bar 10, but there's only 13 it can throw at you. Out of all the 13 bars, these two are the most important. I call them elephants and tails. Elephant bars are sizable, solid green bars that are larger and taller than the vast majority of the green bars before it. Power bar, green, or you can get a power bar to the downside. Red, boom, solid power elephant bar. You see, the institutions move the market. You don't move the market. Your family doesn't move the market. Your neighbors don't move the market. Your friends don't move the market. Institutions with billions of dollars move the market. They when they go in, they wish they did not leave a They wish they could go in without leaving a footprint behind. But they can't. They're too big. Their footprint, these elephants leave behind, boom, big footprints. This is the footprint of an of a giant elephant getting out of the of the market. That top one is a giant elephant bar, a footprint of an institution or institutions getting into the market. The bars at the bottom, the bottoming tail bars are similar in power to the elephant bars. They're also footprints that the market institutions are getting into the market. So in all all four of these bars, the market has moved up. So the bottoming tail bars are an indication that the market was at the bottom of the tail and moved toward the top of the body. All right. The green bar as well from the bottom move to the top. So these four bars indicate money going into the market. And the next four bars represent money coming out of the market. Now, let's take these two power bars and let's start our trading day. Your goal is to take a list of stocks. Let's say you've got 10. Out of 10 stocks on your list this morning, you're not going to play all 10. You're going to just before the open select the three or four that are in what state? You want to say, "Oh, yes, that's right. Out of these 10, these four have the moving averages close." Now, you've got your four to focus on right at the open. Now you're going to determine out of those four which four opens above with an elephant or opens above with a tailbar or opens below with a red elephant or opens below with one of the topping tail bars. So we want these bars below and these bars above the narrow state. And so all this becomes is a waiting game. You select which stocks have the narrow state, then simply watch and wait which ones open with an elephant or bottoming tail bar above or an elephant or topping tailbar below these narrow states. And when none of your stocks do it, you drink coffee. You let the first twominute bar finish, no action in the first two-minute bar. Right now, once that first twominute bar has completed itself, you're going to mark the high of that bar off. one penny above that bar's high. Boom. You're going to put \$25,000 of your money or my money in the stock that moment, that instant. You're going to take literally half of your account and boom, pile it into the stock. Now,

you let the first bar finish trading. You do not let the second bar finish trading. So, the moment the instant the second bar crosses the high of the first bar, boom, your \$25,000 is in. And I want you to protect yourself one penny below bar one. Limiting your loss to one bar is a professional loss.

That's your job. If you do 10 of these,

10 of those, and every one that hits that red line, boom, cut, cut. Out of 10, eight. You'll only cut probably twice, but you'll have eight that just go without your help. Only two you'll have to cut, maybe only one every now and then. You're looking for one of these two. Same thing. No difference whatsoever. Let that first two bar two bar form. And you see it forming. It's 1 minute and 45 seconds. 1 minute 50 55 seconds. Wow. This is a bottoming tail bar. It's above my moving averages. The moving averages are tight. Saliva begins to drip down the corners of your mouth. Mark off the high. One penny. Get ready. Boom. 25,000 in and your protection goes where?

Under which bar? The first bar. You're limiting your loss for the rest of your life to one bar.

The market will give you eight bars, six bars, 20 bars, 15 bars, three bars, two bars, but you will not allow it to move more than one bar against you ever.

Do this and you will be in this business forever. Look to the left hand side of this chart. Look at your moving

averages. What state are we in? I know you know it. Excuse me. Narrow. Look at the first

bar of the morning. Gap up above the narrow state. Solid

green bar. Which bar do you see where you enter? Once that first bar finishes trading, mark the high of the first bar off. Whichever bar is the next bar to break above the high. Boom. Gets your 25,000. You're entering it looks like on bar three. Do you see that? Bar three is the one that pokes through. Where's your protection? Under bar one. Two minute chart of

Disney here. This that dotted line is the first bar of the day. Marks the the first bar of the day. Solid fat green bar. Moving averages tight.

Mark the high of that bar off. Which bar gets your 25,000?

The second one, your stop below bar one. All right, good. We got it. Now, that's the foundation. Trading is not a complicated thing. I want you

to think about it. You got three directions: up, down, and sometimes

sideways. That's complicated. That's primitive. You know what's

complicated? The human body. Billions of processes are going off right now.

The engine of a Ferrari. Now, that's Wow. That's complex.

The market. No. You know what the essence of trading is? Kicking out those not performing and then staying out of the way of those that perform.

That's at the core of everything. But if you get the states right, if you start adding the states to your overall

analysis and you start playing the right bars that indicate this is not a normal buyer, this is an institutional footprint. Institutional footprint in the right

location in the location in the right state and you stack the odds in your

favor. This is how I broke records on Wall Street. They said that it couldn't be done. Biggest gain in 20 minutes,

80s something million. 20 minutes

that it couldn't be done. This has an 80 plus%

followth through rate. I've been doing it for 33 years. I've

been trading for 38 years, but I've been doing this for 33 years,

and it works just like it did 33 years ago. All right, look at this bar. First bar of the morning. All right, your moving averages are relatively close. They're not far far apart. What are you doing right now? Salivating. Don't wipe. You might miss the trade. Do the trade then wipe. Okay. All right. Mark the high off. Boom. Get ready. Boom. 25,000 in your protection. R1. There you go. That circle would represent a short-term move up where I'd start taking some profits. My general profit taking thing is I'm looking for the stock to make three pushes. So push one like it pushes my profits. Push two and then after push two I start throwing sell orders ahead of the market so that the market comes to push three area and executes me. That's a more professional sell than waiting and then selling when it gets there. Getting your order there in advance. Let's take this. Here's another example. First two-minute bar of the morning, you've got a nice tight state. Now, remember, you know, before the market opens which stocks have tight states. So, you're pulling out of your list. You you have a list of 10 stocks. You're pulling out the small few that have a tight stake. Focusing on that now. Oh, marked the high off. First two minute has given you a nice solid bar. Here's your entry. \$25,000 in protection under bar one. Boom. Three push. Take some profits. I think we've got this part down. You've got another 25,000. Now, that 25,000 in your pocket doesn't do me or you any good. We got to put that in the market, too. So, now I've got to teach you how to add to your winning plays. Every master trader adds the winning plays. Every big trader is an adder. There's never a you can never be a big trader if you're an ABC trader. A in B out. No, you want to go in and then in and then in in your winning players usually two ads. Why do you think we don't put all 50,000 in? Why try it with half and not all of it? Because if this is going to be one of the ones that don't work, I want it to not work on half. No, not work on all of it. So, let me put half in. Let's see if this thing gets some momentum and then I can add the rest. That's why we only put half in initially. The ad. Let's talk about the ad. Now, we're going to play the color game on the ad. This is very basic. The very first red bar that occurs, a red bar means that the stock kind of softened, went down a little bit. The very first red bar, you're going to take notice. If that red bar does not produce another red bar after it and a bar takes out the high of the red bar, boom, you're going to add more. So, you're going to add when the market removes one red bar. How does it remove it? By trading past it. All right? So, just like that, that add arrow is one penny above the high of a single red bar. Now, I want you to think of this as like two soccer teams. There's or two football teams, whatever, basketball team, whatever. There's a green team and a red team. And so, you've only seen the green team have the ball in bar one, bar two. Now, the red team gets the ball and produces what? That's it. That's all you got. Now, do you see where I'm going? When red shows you that it is very weak because it can't give you not not only can it not give you more than one, it gives you a little one. Now boom, add when that little one is removed. Now it doesn't matter whether or not your first bar is elephant, your first bar is tail. Now we're we're adding the color game. your entry can be the first little red bar that gets removed. So even if you

don't have an elephant or a tail, your first play can be the first little red bar that gets removed. So now you've got three things to play. Elephants, tails, and little red bar takeouts. Elephants, tails, and little red bar takeouts. play these three things in the right location in the right state. You got a money making machine in the first 20 minutes of the trading day. All you need is money to do it and I've got the money. So listen, people say, Oliver, why do you why do you travel the world teaching this? Why do you do this? Why don't you just trade? You don't see this. When I'm trading this on Microsoft, what about the elephant bar in the right location in Twitter?

What about the tail bar in Facebook

or the red bar being taken out in Apple? But I'm playing Microsoft.

I want not just Microsoft. I want the Twitter one. I want the Facebook one. I want it all. Do you understand? So listen. So, but check this out. If I gave you 50,000, you 50,000, you 50. Let's say you have Facebook, you've got you've got Microsoft, you've got Apple, you got this. Now, don't miss these three things. Now, I've got them all. But what I do is I multiply me.

Do you understand? I give you my capital and multiply me and we both win.

That's why I do it. There's power and numbers. I can't be in every spot and

every stop that is producing an opportunity, but we as a team can. All right, guys. Look, bar opens above. Don't be overly concerned with the gap.

The only thing is if that gap is too far, then you have already starting at a wide state. So too far gap. What's the best play? Up or down? This is not that far. That's not too far. All right. Mark the high. Boom. 25,000 in. Stop below the low. There's your first red bar. It's not that big.

It's rather small. Mark the high of that bar off. Boom. Whenever that bar is taken out, that's your ad. Now, I suggest that you take that 25,000 and divide it into two parts. So, you put 12 or 13,000 in and then do another one.

There's your profit take. You've got three pushes. Push, pause, push, push out. I'm not marrying stocks off the open. All right? You understand? I'm in and out. This is two, four. This is 20

minutes, 18 minutes or whatever it is. Out, finished, done. Go to the beach.

All right. Or the park or whatever it is that you do. I do have traders that will trade a good portion of the day. But I

want every trader to have my specialty. My specialty is the first 20 minutes.

There's your moving averages. relatively narrow, solid, fat. That's an institutional bar. You and I can't produce a bar like that in Microsoft. It takes billions of dollars to produce a bar like that. We know that's a footprint that's going in and it's a big

one. Mark the high off. We got the right state. We've got the right location. Remember, the location and the state are

different. Location is above or below. State is narrow or wide. So, you want the location and the state correct and the bar correct. Get those three things correct, you got a money-making machine. All you need is money.

All right. Boom. Enter. Stop.

Look at that first little red bar. That's all you got red. That's it. Mark off the high. Boom. There's your ad. Playing the color game now. Three pushes. Push one, push two. Throw your order above the market. Let the market come to that push three area out. Go to the beach. Can you play again if you

want? Yes. You see these series of reds going down. The very next time a green bar eliminates red starts the game again. Boom.

Boom. But you must be near the blue 20 period moving average. You can't do the color game that after the first one. You can't do the color game after that unless it's kind of close to the 20. No. Away from the 20. If it comes back toward the 20 period moving average, the blue line, you can start the color game again. Green takes out red. Boo. Where's your stop? Always under bar. There's red. Throughout the process again, there's your ad above a little red bar. Three pushes up out. Why three pushes? The market has a strong tendency to pause, rest or or reverse after three to five pushes. But you get three obviously a higher percentage of time than you get five. So that's why I'll always teach traders start coming out on three. All right? You might get five, but you'll certainly a higher percentage of time get three. I live where things happen certainly. This is short-term trading, guys. You're trading the first 20 minutes of the morning. You're trying to earn your living in 20 minutes. You're trying to grab three \$4,000 6,000 8,000 whatever it is in that first 20 minutes of trading. And it's shortterm and its accuracy is the reason for its accuracy is because the term is short. The shorter term trader has a greater chance of being more accurate than the long-term trader. Right? And I'll prove this to you. If I were to ask you where you're going to be 10 years from now on this very day of the month, 10 years, you'd have no freaking clue. If I were to ask you where you'd be one year from now on this very day, you'd still probably have no clue. If I ask you where you'd be one month from now, a little bit better one day from now. What about if I asked you where are you going to be 2 minutes from now? You would get that right every two minutes of your life. You will never be wrong. But what if you just lived the market two minutes by two minutes? If your accuracy is the highest in this twominut period, why not live your market life 2 minutes? Because your ability to project what flow up or down over the next two, four, six minutes is extraordinarily high with what I've just given you. But if I were to stretch that and say over the next week, it would break down. So we live in this high probability, highly consistent window and then we just put big money behind it. What if boom you get a red bar up there? What do you do? I want to see you're you got narrow state stock opens above bullish territory but boom bearish bar. What do you do? Drink coffee. nothing. But if the market removes this bar, you're going to mark the high of that red bar off. If a green bar eliminates that red bar, so if you get this scenario, boom, if the problematic thing is removed, that's your end point. Stop below the low. Now, that may not happen. that may that red bar might produce a second red bar and a third red bar and it's it's a nothing trade then you don't do anything on that trade. But if that red bar is taken, boom, that's your entry right off the open there. Okay, now that's that scenario. Look at the first bar opens above the moving averages and produce a red bar first. The second bar removes the problem and you're in right at the high. Right as the green bar eliminates the high of the red bar, stop below the low. Three pushes out. All right. And then you can start playing the color game again as it comes back in.

Look at the series of red. When does green eliminate red again? I wish I had a pointer but and then the move up out done. Now these are not just perfect examples traders. I can show you thousands upon thousands of charts. Red bar starts off the morning green bar eliminate second green bar eliminates the high in stop below the low. three. Let's follow this trade. You tell me which bar is your entry bar. The second one, where is your stop? How much money do you have in the play on bar two? 25,000. Okay. What's your next act? Eliminates the first little red bar. Add. And then what's your next action? After the push out, right? And then let's continue. Do you see your next act? The second green bar after that final red bar that dips right. You got it. Boom. Three pushes up out. This most people are over complicating this game. They're looking at PE ratios, sales ratios, company management, product sales, product this, projections. Uh it's too complex. When I left the street, every firm began sending me their top traders. I charged them \$25,000 per trader per week. And I was booked because I did a maximum of 10 traders a week. I trained Wall Street. 10 traders a week, \$25,000 per head. I was booked for 12 years. I perfected how to simplify this game and turn an individual into a money machine. It is not by mistake that I have over 10,000 traders worldwide today spread all over the world. That is not women traders. Yes, they are some of the best traders. Do you know why women make the best traders most of the time? Ego. They have less of it. It's not that they don't have ego. they just have less of it. So when the stock doesn't work and the stop is hit, the woman says Oliver says, "Get out here. Okay, I'm out." But men are like, "Shoot, man. Maybe he'll maybe he'll come back. Maybe he'll rebound. Maybe I should add." And so there's less of that. And so women tend to be more disciplined as well. Naturally more disciplined. There are certainly personality types that can make trading a little easier, but you just have to have a reliable set of items that repeat themselves over and over and over again. Reliable set of items, proper trade management, knowing when to cut, when not to cut, when to add. In just a short period of time, you can now look at any chart in the world off the open and say, "This is where I enter. This is where I protect myself. This is where I add and this is where I'm taking profits." And that imagine if you gave me six months of your life where I could take you. Now, I have to add one more thing here. You can't leave your original stop at the bottom of bar one. as the stock progresses, you got to move that protection up. You don't want to lose a tremendous amount of your profit in the form of a sudden collapse. So, we got to learn how to move that stop up. So, I want you to look at all the big fat green bars on that chart. Look at the fat sizable ones. Look at that fat bar. Look at that one. And then look at that one at the top. Every fat bar, you move that protection right under the fat bar. You see, healthy stocks don't eliminate their fat bars. Move that stop under. So, right after you add above that red little red bar, that bar starts growing, growing,

growing. Boom. Big bar. Move the stop under the fat bar. And you can fat bar by fat bar your way to the promised land.

Boom. Boom. Fat bar. Fat bar. Fat bar. Fat bar out. Now, while you're raising your stop, you're also taking profits on three pushes. Don't think you have to be stopped out. The stop is just in case something bad starts to happen, but you want to take profits on the way up, not on the way down. On the way down is hitting your stop. That's just in case. But the ideal way to get out is with the momentum on the way up and then you cancel your stop.

You should know this by now. First fat red bar gets taken out by a green bar from a narrow state. Moving averages are tight. Your entry is above the moving averages. So you're you're you're doing everything in the right position. You get your three pushes. You're out of this. This is boring now. Boring. This is my favorite. I love going short. I love betting to the downside. By the way, guys, that's not what I predicted in Orlando. One of the biggest falls in history. I predicted this at a time when the market was at all-time new highs. So, the reason the you can do this now. Where were the moving averages on the NASDAQ or the Dow or any major index? How do they look together like that? They are so far apart they can't see one another. The state is too wide. That's not the time to buy. The time to buy is when your state's narrow. Right? I taught you that. But now you can apply that to anything and know you got to know your state. Then you got to know which events in the right state in the right position.

And if you get those three, your odds explode. All you need is money. So now we're going to bet this to the downside. 25,000 in. Boom. Short protection above the high bar one. Everything is in reverse. Now, yes, we make more money on the downside than on the upside. Why? Because items fall faster and harder than they rise. Give me a short over a long any day and twice on Sunday. Boom. There's your entry. Look at the narrow state to the left of the chart. First bar is solid red under the low. Trigger 25,000 in protection above the high. Look at your first little green bar that forms gets taken out. Boom. That's your ad. And you got more money to the downside. All right. Look at this. You guys know this to right now. You can tell me to the penny where you put 25,000 in, where are you to the penny where your protection is, to the penny where you add, and now to the penny where you adjust your stop. Walk this stock down. Do it now. fat bar by fat bar your way to the promised land. You got it. You see it? First stop on bar one. Where do you walk that thing down to? The next big bar. See the next big bar. The next big bar. The next big bar over here. So I'd say something like boing boing boing. Okay. Now there's one more I want to add. We're going to add one more stop adjustment and we're done. You're going to add the color stop adjustment, not just the big bar. You're going to add this. So, every time you get the opposite color, when we're betting down, green is the opposite color. When you get the opposite color, green, followed by two red, green, red, red. Adjust your stop on top of the green. Green, red, red. Adjust your stop on top of the green. Green, red, red. adjust your stop on top of the green. So now you got big bar adjust color adjust. You do them both whichever one happens next. So your stop adjustments now go from the original stop at the top of bar one. See the green red? Move the stop on

top of green. You got it? Then what happens next? A big bar happens next. Move your stop from the green to the top of the big bar. After that, what happens next? Green, red, red. Now move your stop on top of the green. What happens after that? Big bar. Now move your stop on top of the big bar and you can walk. This is professional trade management. Very few people, this is the highest level. Very few people know how to manage the trade in between the buy and the final exit or the sell in the final cover. They don't know what to do in the middle. They don't know how to walk the dog. How you do boring now? And it's supposed to be if you are really excited, you're probably doing something wrong, right? You want entertainment, go to Disney World. This is the same thing. It's not exciting. It's not supposed to be. What you do with your money should be exciting. But the same boring thing every single time, every single day, every single trade, that's what it takes. Being boring. I want to show you something interesting here. What if the bar is green under? What do you do? Your first bar under the moving averages is green. What do you do? Wait, drink coffee, right? All right, take a look at this. If it's green, boom. That's your entry. The removal of green. Now, check this out. Check this out. This is cool. You're watching this twominute bar form under a narrow state. It's not full two minutes. Let's say it's a minute. Let's say it's one minute into its twominute life. You're watching this. You're just like, "H, green bar." But if that green disappears, boom, I'm in. Right now, watch it. It It produced green in the first part of its life. 1 minute, but then 1 minute and 15 seconds less green. 1 minute and 30 seconds less green. And at the end, and and at the end of the green, boom, that's your new entry price. So now I'm teaching you how to actually go into the first twominute bar if it produces green first and then wipes the green out inside of the first two minutes. Do you understand this? So you are watching the market open green then less green less green less green. Boom. Once the green is over, you get in at that point, stop above the high and this is your drop. So, normally you would be getting in under the low of bar one. No, you're now getting in higher because the first move was green, giving you the bottom of green as a reference point. And anytime whether it's the same bar or the next bar eliminates the green, you're in. It doesn't matter. We call this hidden green plays. The green is hiding from you. You start to add the hidden plays. Wow. The opportunities explode. There's that green movement. First mark the low of the green. Boom. This one, this green did not get erased the same bar, nor did it get erased bar two, but it did erase the green bar three. Doesn't matter. Boom. There's your entry. There's your There's the first green bar after your original entry point. Mark the low. There's your ad. Boom. And the rest is history. What should you always do when your stock goes from narrow to wide? If you're in the play, you were in the play from narrow, now it goes wide. Should you still keep it? No. So, you see where I have the circle? Look at the distance now from the move. Look at the left when everything was scrunched together and look at the move away. you should be getting out. So the best time to get in is near and when you get away, you should be exiting. Get in near away exit. It's not complicated. It's simple, not easy because see the bars aren't moving on this chart, right? Oh, it's easier when the bars start moving and your palms start getting sweaty and

butterflies start moving in your stomach
and stuff like that. But it is simple. We go from a wide state. We go from a narrow state to the left to a wide state back to a narrow state. Can you play the wide state back to narrow? Yes or no? Yes. What what kind of bars do you play from a wide state? Same ones. Elephant. Boom. Bottoming tailbar. Boom. So, which bar did you get here? Bottoming tailbar from a wide state. You can try that. Look at the elephant bars. Look at this elephant bar. Long as you're playing the right events
in the right state, 87
